Application: Greenhouse
Fuel: Wood Pellets

Isabelle De Menezes operates a successful tomato greenhouse in Boucherville, PQ. Isabelle is always looking for ways to make the family business more efficient and researched burning biomass fuel to achieve cost savings for heating over 50,000 square feet of greenhouse. Isabelle spoke with a Pro-Fab retailer, Andre Belanger, who later supplied a Pelco for her business. Isabelle is very happy with the savings they have achieved with their Pelco, operating in weather conditions as cold as -40° C. Les Serres Primavera chose to burn wood pellets at its facility and has been very happy with the clean chimney exhaust due to the Pelco cyclone chimney attachment on the boiler, which reduces emissions to the atmosphere. When Isabelle isn't busy running the business, she has been active showing their Pelco unit to visiting greenhouse operators who are looking for ways to reduce their costs while being good to the environment burning biomass energy.
